
a
CHIME/FRB
central window
$\nu$ (MHz)
S/N
$t - t_{\mathrm{peak}}$ (ms)
b
DSA-110
central window
c
Normalized profile
d
e
$I = 4.52 \times 10^9$ Jy ms Hz
$\int_{\mathrm{on}} S_\nu \, dt$ (Jy ms)
f
$I = 6.58 \times 10^9$ Jy ms Hz
g
Measurement chain
$S_\nu(t) = \frac{(\mathrm{S/N})_\nu(t)\,\mathrm{SEFD}_\nu}{\sqrt{2\,\Delta\nu\,\Delta t}\,G_\nu}$
$I_X = \int_{\nu_1^X}^{\nu_2^X} \int_{\mathrm{on}} S_\nu(t)\,dt\,d\nu$
$E_{\mathrm{iso}} = \frac{4\pi D_L^2(z)}{1+z}(I_C + I_D)$
Window gate
3 thresholds × 3 padding factors; accept only if every window succeeds and fluence spread is at most 10%.
Zach example: 1.7% CHIME/FRB, 0.3% DSA-110
Candidate only: calibration, correlated-noise, and visual-review gates remain pending.
No fitted burst amplitude enters this chain.
